

Question 1 Answer:

Sentence 1: This sentence has more of a positive rating than a neutral one (and its negative rating is 0) so the compound rating is 0.6. That means the sentence is overall considered to be positive. Reading it I agree and believe that VADER's valence scores are accurate. I think the positive score can be explained by the lack of outright negative words as well as the existence of the word 'Love'.

Sentence 2: This sentence has a compound rating of -0.5. This is driven by the negative ranking of 0.627, the neutral rating of 0.373, and the positive rating of 0. This is a surprisingly correct result. Although the word 'love' is in the sentence, it is negated by the word 'don't' in front of it. In this case, the VADER model performed very well.

Sentence 3: This sentence has a compound rating 0.7579. Even though it is the same words as sentence 1 (which has a compound score of 0.6369). This is because sentence 3 has a higher positive score. This is most likely because of the smiley face created with punctuation. This is impressive performance from the VADER model because it identifies the positive impact of a drawn out smiley face.

Sentence 4: This sentence has a compound score of -0.4404. Its positive rating is 0, its neutral rating is 0.508, and its negative rating is 0.492. This is driven by the description of houses being ruins (because ruins is a negative word and it is assigned to the subject of the sentence).

Sentence 5: This sentence has a compound score of 0.5867. This is driven by high positive and neutral scores as well as a negative score of 0. This is once again impressive performance of the VADER model because the sentence contains the word 'ruins' but it is negated.

Sentence 6: This sentence has a compound score of -0.4. However, this result is not accurate, as the sentence does not seem to be actually negative. I believe that the VADER model saw the word 'lies' and therefore considers the whole sentence to be negative. In this context, the word lies means something else, but the model doesn't understand that.

Sentence 7: This sentence has a compound score of 0.3612. This is driven by a large neutral score of 0.667, a positive score of 0.333 and a negative score of 0.0. I agree with the compound score as it indicates the sentence is overall neutral but leaning towards positive. This is how I interpret it as well.
